

Capability Overview: Health.

Health today and for the future.

Today's greatest challenge in healthcare is providing cost effective and risk reducing solutions to improve patient care. An aging population and exponential growth in chronic disease is putting pressure on healthcare providers to effectively manage both increasing patient volumes and more complex care requirements. Simultaneous demands to reduce costs and improve services are exerting extraordinary pressure on the sector.

Visionstream solves these challenges by working with health sector operators to deliver efficient, end-to-end solutions that help cut costs and improve patient care. Our customised approaches provide a highly available and reliable network infrastructure, reduce the number of interfaces for clinical employees, improve system interoperability and ultimately, increase clinicians' time with patients.

The Visionstream difference.

We know that no one solution is the right fix for all problems. We work with you to understand your needs and together we find the best possible solution for your challenge.

Our dedicated health team has deep experience across a range of technologies and will work with you as well as the best and most innovative vendors in the market to deliver an end-to-end, value-for-money solution, from design to install.

Information anytime, anywhere.

In order to effectively access and manage large amounts of information, healthcare providers are becoming more reliant on highly available networks to ensure all connected devices can access the systems anywhere and at any time, without delay. Visionstream provides the expertise to analyse existing infrastructure, design new intelligent networks or upgrade and enhance existing networks.

Our medical-grade solutions span:

- Wide area public and private networks
- 3G, 4G, LTE networks
- Real-time Location Services
- Campus based wired and wireless networks
- High Availability data centre solutions
- PABX and IP telephony
- Securing network access
- AusHFG, seismic and anti-ligature rating.

Solutions for better patient outcomes.

Through our Visionstream Imatis Joint Venture, Imatis Australia, we deliver a world-class unified user interface solution that connects people with information and workflow. Our solutions support healthcare providers with a common communication platform for administrative and clinical applications and devices, which also integrates with other systems such as Nurse Call and security systems.

The result is an approach to healthcare that focusses on better patient outcomes through:

- Patient and doctor self-service
- Mobility
- Effective patient flow
- Lean logistics management.

A unique user interface.

The Imatis suite is unique, as it empowers providers to extend the capabilities of their current systems, rather than replacing mission critical systems. By designing new workflows using the Imatis engine, we can reduce the need to make costly and time consuming changes to environments.

This approach enables our customers to make changes to their workflows and environment without changing the overall look for their employees and patients. To date, this approach has been extremely successful throughout Europe.

Imatis offers a number of different user interfaces that can provide a unified view, including:

- Check-in kiosk
- Whiteboard configurable for any department (A&E, Ward, Housekeeping, ETC)
- Resource management
- Clinical pathway management
- Smartphones
- Smart watches
- Visual Health Record
- Home Care/Community care with Telehealth Integration
- Automated task management
- Security alerting
- Task allocation
- Security system control
- AGV control and management
- Nurse-call alert and escalation management.

More efficient use of clinicians' time means improved patient care.
